## **NOAA Technical Memorandum NMFS**

The National Oceanic and Atmospheric Administration (NOAA), organized in 1970, has evolved into an agency which establishes national policies and manages and conserves our oceanic, coastal, and atmospheric resources. An organizational element within NOAA, the Office of Fisheries is responsible for fisheries policy and the direction of the National Marine Fisheries Service (NMFS).

In addition to its formal publications, the NMFS uses the NOAA Technical Memorandum series to issue informal scientific and technical publications when complete formal review and editorial processing are not appropriate or feasible. Documents within this series, however, reflect sound professional work and may be referenced in the formal scientific and technical literature.

## NOAA Technical Memorandum NMFS

This TM series is used for documentation and timely communication of preliminary results, interim reports, or special purpose information; and have not received complete formal review, editorial control, or detailed editing.

## ABSTRACT

This report provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) cruises conducted off California and Baja California in 1968. It is the eighteenth report in a series that presents these data for all biological-oceanographic CalCOFI surveys from 1951 to the present. A total of 319 stations was occupied during 3 cruises over a survey area which extended from Pt. Reyes, California to Cape San Lazaro, Mexico and seaward to several hundred miles. The data are listed in a series of 5 tables; the background, methodology, and information necessary for interpretation and quantitative analysis of the data are presented in an accompanying text. All pertinent station and tow data, including volumes of water strained and standard haul factors, are listed in the first table. Another key table lists, by station and month, standardized counts of each of the 113 larval fish categories identified from survey samples. This and previous and subsequent reports make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the newly developed computer data base.

## INTRODUCTION

This report, the eighteenth of a series, provides ichthyoplankton and associated station and tow data from California Cooperative Oceanic Fisheries Investigations (CalCOFI) joint biological-oceanographic survey cruises conducted in 1968. This program was initiated in 1949, under the sponsorship of the Marine Research Committee of the State of California, to study the population fluctuations of the Pacific sardine (*Sardinops sagax*) and the environmental factors that may play a role in such fluctuations. CalCOFI, known as the California Cooperative Sardine Research Program from 1949 to 1953, was made up of representatives of the South Pacific Fisheries Investigations (SPFI) of the U.S. Fish and Wildlife Service [now the La Jolla Laboratory, National Marine Fisheries Service (NMFS)], the Scripps Institution of Oceanography (SIO), the California Department of Fish and Game (CDFG), the California Academy of Sciences (CAS) and the Hopkins Marine Station of Stanford University. The first three of these agencies supplied ships and personnel to conduct the sea surveys. NMFS processed the plankton samples and analyzed the ichthyoplankton from them. SIO processed and analyzed the hydrographic samples and measurements and also analyzed invertebrate groups from the plankton samples.

The boundaries, station placement, and sampling frequency for the CalCOFI survey area were based on the results of joint biological and oceanographic cruises conducted by NMFS and SIO during 1939-41. Those cruises were designed to collect sardine eggs and larvae and associated hydrographic data over the entire areal and seasonal spawning range of the species. On these survey cruises, plankton tows were made to 70 m, a depth which encompassed the vertical distribution of sardine eggs and larvae.

Wide-ranging joint biological and oceanographic survey cruises were resumed in 1949 with sardine as the focus; however, an increasing interest in other biological components resulted in the deepening of standard tows to 140 m in 1951. This marked the beginning of truly quantitative ichthyoplankton sampling on CalCOFI surveys.

Data resulting from CalCOFI surveys in 1968 have been published in a number of forms. Hydrographic data (Univ. of Calif., SIO, 1971) were presented in a standard format. Distributional maps of larvae of 2 taxa taken on CalCOFI surveys during 1968 are presented in the CalCOFI Atlas series: rockfish (*Sebastes* spp.), Ahlstrom et al., 1978; northern anchovy (*Engraulis mordax*) Hewitt, 1980.

A computer data base for eggs and larvae of sardine and anchovy, for larvae of Pacific hake (*Merluccius productus*), jack mackerel (*Trachurus symmetricus*) and Pacific mackerel (*Scomber japonicus*), and for eggs of Pacific saury (*Cololabis saira*) was established in 1969. The development of a data base for other fish larvae is a complex undertaking because competency of identification has evolved steadily over the past 38 years. We began the task of producing a CalCOFI ichthyoplankton data base and associated data report series in 1983. All available original records for 1968 were subjected to an extensive verification and editing process to produce this report. This and previous (Ambrose et al., 1987a,b,c; 1988a,b; Sandknop et al., 1987a,b; 1988a,b; Stevens et al., 1987a,b,c; 1988; Sumida et al., 1987a,b; 1988a,b) and subsequent reports make the CalCOFI ichthyoplankton and station data available to all investigators and serve as guides to the computer data base. The data base will be modified when additional errors are discovered and when composite taxa from the earlier years are reidentified. These reports are the fundamental reference documents against which subsequent changes in the data base can be compared.

#### SAMPLING AREA AND PATTERN

In 1968, CalCOFI survey cruises were conducted in January, April-May, and June. A total of 319 stations included in the data base was occupied on 3 cruises, with an average of 106 stations per cruise (range 59-133). Coverage of the survey station pattern varied among cruises and the entire area was not covered on any single cruise (Figures 1-4, Table 1). Although the area surveyed during 1968 was more extensive than in 1967 (258 stations were surveyed in 1967), coverage for these 2 years was considerably less extensive than in other years of the decade. The area off northern California (lines 40-57) was not surveyed in 1968. Stations off central California (lines 60-77) were occupied in January and June (Cruises 6801, 6806). The area between Pt. Conception, California and Cape Colnett, Baja California (lines 80-103) was surveyed in January and June with coverage extending to line 113 in June. The area off central and southern Baja California (lines 117-140) was surveyed only in

April (Cruise 6804). Coverage extended seaward to station 100 (approximately 200-300 miles offshore) on lines 60-93 (Cruise 6801) but typically did not extend beyond station 90 (approximately 160-260 miles offshore)<sup>1</sup>. Some inshore stations were occupied during 1968 which were not covered on early CalCOFI surveys. These stations were included in the data base (Table 1) but were omitted from the station plots (Figures 2-4).

Two vessels were employed on these cruises: the *David Starr Jordan* of NMFS and the *Horizon* of SIO. The *David Starr Jordan* was used on two cruises and the *Horizon* on one (Univ. of Calif., SIO, 1971).

#### SAMPLING GEAR AND METHODS

The standard CalCOFI net used from 1949 to 1969 had a 1-m diameter mouth opening ( $0.785 \text{ m}^2$  area) and an overall length of about 5 m. The net was constructed of 30xxx gauze, a heavy duty grade of silk bolting cloth, with a mesh size of 0.55 mm after shrinkage. The last 40 cm of the cone and the cod end were constructed of 56xxx grit gauze which had a mesh size of 0.25 mm after shrinkage. The net ring was fastened to a short 3-lead bridle connected to several meters of line which attached to the towing cable by a clamp. A current meter was suspended in the center of the net mouth to measure volume of water filtered (see Kramer et al., 1972, for further details).

The standard tow from 1951 through 1968 was an oblique haul to 140 m depth (to 15 m of the bottom in shallow areas) designed to filter a constant amount of water per depth interval (ca.  $3\text{m}^3/\text{m}$  of depth) over the vertical range of most ichthyoplankters. Hauls were made at a ship speed of 1.5-2.0 knots and initiated by clamping the net line to the towing cable with the 45 kg terminal weight about 10-15 m below the surface. The net was lowered to 140 m depth by paying out 200 m of wire over a 4 minute period (35 m of depth/min.). After fishing at depth for 30 seconds, the net was retrieved at 20 m/min. (14 m depth/min.). The angle of

---

<sup>1</sup>CalCOFI lines (Figure 5) are arranged perpendicular to the coastline and extend from the Canadian border (line 10) to below Cape San Lucas, Baja California (line 157). Stations were established on the basis of a perpendicular to line 80 (off Pt. Conception) at a point designated as station 60. Stations were plotted seaward and shoreward from station 60 on each line. Cardinal CalCOFI lines (those ending in "0") are 120 miles apart and usually bracket two ordinal lines (ending in "3" or "7"), so that lines are 40 miles apart over most of the pattern. Cardinal stations are 40 miles apart and typically these are separated by a station number ending in "5" so that stations are 20 miles apart out to station 90 on most lines. Stations are placed at closer intervals near the coast and islands to accommodate these features (see Kramer et al., 1972 for further details).

stray of the towing cable was recorded every 30 seconds and maintained at  $45^\circ$  ( $\pm 3^\circ$ ) by adjusting the ship speed and course. After reaching the surface, the net was washed down and the samples preserved in 5% formalin buffered with sodium borate. Flowmeter readings were made at the beginning and end of each tow. Detailed descriptions of gear and methods are given by Ahlstrom (1953), Kramer et al. (1972), and Smith and Richardson (1977).

#### LABORATORY PROCEDURES

Laboratory processing began with the determination of a displacement volume for each sample (methods described in Staff, SPFI, 1953 and Kramer et al., 1972). Sorting involved the removal of ichthyoplankton from the sample and identification and separation of: eggs and larvae of Pacific sardine and northern anchovy; larvae of Pacific hake; and eggs of Pacific saury. In 1968 each sample was sorted completely.

A "standard haul factor" (SHF) was calculated for each tow to make them comparable and allow estimations of areal abundance. This factor adjusts the number of eggs or larvae in a haul to the number in  $10 \text{ m}^3$  of water strained per meter of depth fished. If the vertical distribution of the species has been encompassed, then the adjusted value is equivalent to the number under  $10 \text{ m}^2$  of sea surface. The SHF is calculated for each haul by the formula:

$$\text{SHF} = \frac{10}{V} D$$

where  $D$  = depth of haul = cosine of the average angle of stray of the towing cable multiplied by cable length (m)

$V$  = total volume of water ( $\text{m}^3$ ) strained during the haul

$$V = R \cdot a \cdot p$$

where  $R$  = total number of revolutions of the current meter during the haul

$a$  = area ( $\text{m}^2$ ) of the mouth of the net

$p$  = length of column of water (m) needed to produce one revolution of the current meter.

Tow depth, volume of water strained, and standard haul factor are listed in Table 1 for each tow taken during 1968. Detailed descriptions of factors involved in calculating these values are

presented in Ahlstrom (1948), Kramer et al. (1972), and Smith and Richardson (1977).

#### IDENTIFICATION

Identification of ichthyoplankton species beyond those separated during the sorting process was carried out by a separate group of specialists. Ontogenetic stages of fishes are inherently difficult to identify and this is further complicated by the large number and diversity of species which contribute to the ichthyoplankton of the California Current region. Most identifications were accomplished by establishing ontogenetic series on the basis of morphology, meristics, and pigmentation and then identifying these series by relating them to known metamorphic, juvenile, or adult stages with overlapping features (Powles and Markle, 1984). A total of 111 taxa was identified for 1968, with 67 taken to species, 20 to genus, 20 to family, and 4 to order or suborder. Beginning with 1961, larvae in the families Paralepididae and Labridae were identified to genus or species.

The task of producing a reliable and equitable ichthyoplankton data base required extensive procedures to verify, correct, and edit the original identifications. The primary data source was the original identification sheets (see Kramer et al., 1972, for examples); however, a critical resource used in all phases of this process was the CalCOFI ichthyoplankton collection in which the samples are archived. Throughout the course of CalCOFI ichthyoplankton studies, samples have been identified to the lowest taxon possible. In reviewing these identifications for the data base, our approach has been conservative and we have preserved those identifications and counts which we could confirm, while correcting as many of the errors as possible. After computer entry, taxonomic errors and inconsistencies in the data base were corrected and the most obvious identification errors were corrected. Our current knowledge of ichthyoplankton techniques coupled with a precise understanding of the development of identification competency in the program over the years allowed us to critically judge the historical records. Identifications were changed to different taxa, lumped to a higher taxonomic category, or given a more precise taxonomic name. In some cases, identifications of a taxon were inconsistent among cruises in a year. These records were made equitable by lumping to the higher taxonomic category to avoid biases that could result in quantitative misinterpretations.

Next, statistical, seasonal, and geographic outliers were identified, employing a series of graphic summaries and listings. Examination of geographic outliers proved to be especially effective because of our accumulated knowledge of species distributions. In the course of examining samples for these outliers, other identification errors were discovered and eventually all taxa were scrutinized to some extent. Lastly,

certain taxa were reexamined in all samples for the entire CalCOFI time series. These taxa were selected because of their commercial, ecological, phylogenetic, or zoogeographic importance or because taxonomic confusion was at the ordinal level. The following is a list of the taxa for 1968 which received special attention, with explanations and caveats intended to aid in quantitative interpretations:

*Anguilliformes* - tentative and sporadic identifications to family or lower taxon lumped to order.

*Engraulis mordax* - some nearshore samples of small *E. mordax* may contain other anchovy genera, which could not be differentiated.

*Nansenia* spp. - all specimens checked and identified as *N. candida* or *N. crassa*; all specimens of these species near their range boundaries checked.

*Bathylagus* spp. - includes small and/or disintegrated specimens of *Bathylagus* or *Leuroglossus stilbius*.

*Stomiiformes* - all specimens checked and identified to genus or species; residuals are poorly preserved or unavailable specimens.

*Sternopychidae* - tentative and sporadic identifications of hatchetfishes to genus were lumped to family.

*Bathophilus* spp. - specimen checked.

*Eustomias* spp. - specimen checked.

*Paralepididae* - all specimens examined and identified to species; residuals are small, poorly preserved or unavailable specimens.

*Scopelarchidae* - tentative and sporadic identifications to genus lumped to family.

*Lampanyctus* spp. - tentative and sporadic identifications to species lumped to genus.

*Lampanyctus regalis* - underrepresented because of inability to differentiate small larvae (<5 mm) from those of other species of the genus; counts may include other species of the genus because of difficulty in identifying larvae of this large and complex genus.

*Lampanyctus ritteri* - comment for *L. regalis* applies to this species.

*Diogenichthys atlanticus* - all specimens at margins of range checked.

*Diogenichthys laternatus* - all specimens at margins of range checked.

*Electrona rissoei* - recognition of this species was inconsistent and others may be included in *Protomyctophum crockeri* or Myctophidae.

*Hygophum* spp. - all specimens reidentified to species.

*Protomyctophum crockeri* - some samples on northern lines may contain *P. thompsoni* which was not identified originally.

Ophidiiformes - this category did not exist originally and ophidiiform larvae were included in *Brosmophycis marginata*, "Otophidium", "Zoarcidae", and "blenny"; identifications of *B. marginata* proved to be mostly correct and "Zoarcidae" to be a yet unidentified ophidiiform species; all "Otophidium" and "blenny" were reexamined and they included several ophidiiform taxa (moved to order).

Trachipteridae - tentative and sporadic identifications to genus were lumped to family.

*Melamphaes* spp. - all identifications ascribed to Melamphaidae were reexamined and assigned to genus (*Melamphaes*, *Poromitra*) or species (*Scopelogadus bispinosus*). Larvae originally identified as *Melamphaes* spp. were not reexamined and this category may contain other melamphaid genera.

Cottidae - all specimens checked.

*Ophiodon elongatus* - specimen checked.

*Oxylebius pictus* - all specimens checked.

*Zaniolepis* spp. - all specimens checked.

*Sebastes* spp. - category may contain other scorpaenid genera particularly in samples south of line 120.

Labridae - all specimens originally identified to family were reexamined and assigned to genus (*Halichoeres* spp.) or species (*Oxyjulis californica*); residuals are small, poorly preserved or unavailable specimens.

*Howella brodiei* - specimen checked; originally included in Apogonidae; in this report we list *H. brodiei* in the family Apogonidae for convenience, recognizing that its systematic affinities are not resolved.

*Seriola lalandi* - all specimens checked.

*Girella nigricans* - all specimens checked.

*Medialuna californiensis* - all specimens checked.

*Sciaenidae* - tentative and sporadic identifications to genus lumped to family.

*Scombridae* - includes small, poorly preserved or unavailable specimens which were originally identified to family; the absence of Pacific mackerel (*Scomber japonicus*) larvae from samples in 1968 was carefully checked, since they were present in all other CalCOFI surveys.

*Pleuronectiformes* - all specimens of this category (originally called "flatfish") were examined and reidentified; residuals are small, poorly preserved or unavailable specimens.

*Citharichthys* spp. - all larvae identified to species were lumped to the genus except *C. stigmaeus*; category includes larvae of *Etropus* spp.

*Citharichthys stigmaeus* - includes larvae larger than ca. 4.5 mm; smaller larvae are in *Citharichthys* spp.

*Paralichthys* spp. - all specimens of this genus were examined and most were assigned to *P. californicus*.

*Glyptocephalus zachirus* - all specimens examined.

*Lepidopsetta bilineata* - all specimens examined; originally misidentified as *Psettichthys melanostictus*.

*Microstomus pacificus* - all specimens examined.

*Pleuronichthys* spp. - all larvae of this genus and constituent species were examined and assigned to species; residuals are small, poorly preserved or unavailable specimens.

*Psettichthys melanostictus* - all specimens examined.

#### COMPUTER ENTRY AND EDITING

Each taxon on the original identification sheets was given a 3-digit code based on the list of codes in Haight et al. (1979). Taxon codes and counts from these sheets were keypunched by cruise and station, along with pertinent station and tow data and entered into the VAX 11/780 computer at the University of California, San Diego, Computing Center. After entries were completed for an entire year, print-out listings of taxa and counts on each station were compared with the original data sheets to eliminate keypunch errors. Next, data in the file were cross-checked with data on an existing file which contained: station and tow data; numbers of eggs of sardine, anchovy, and saury; numbers of larvae of sardine, anchovy, hake, jack mackerel, and Pacific mackerel; total number of fish eggs; and total number of fish larvae.

Discrepancies in ichthyoplankton data in these two files were corrected by inspecting original records from the sorting laboratory, the original ichthyoplankton identification sheets, and the samples themselves. Station and tow data discrepancies between the two files were corrected by reviewing ships' logs and deck tow sheets, original records from the sorting laboratory, cruise announcements, publications, header information on the ichthyoplankton identification sheets, and station plots generated for each cruise. Eventually all station and tow data were checked by comparing these sources.

The corrected ichthyoplankton data base was then examined statistically and outliers were found and checked as above. Distributional plots were then prepared for each taxon and these were checked by reviewing the data sources mentioned above and by examining archived specimens. A listing of each taxon by station (Table 4) was produced, which became the primary document for subsequent checks. Misidentifications found in geographic outlier checks and other misidentifications and data problems discovered in the course of examining archived samples resulted in several iterations of Table 4. Finally, totals in Table 4 were checked against annual summaries of incidence and abundance (Tables 2 and 3). Ecological analyses of the data were conducted concurrently with editing procedures and provided cross-checks that allowed correction of errors.

#### SPECIES SUMMARY

Larvae of northern anchovy (*Engraulis mordax*) represented 39.5% of all fish larvae taken on CalCOFI cruises during 1968 and numbered almost twice as many as Pacific hake (*Merluccius productus*), the next most abundant species with 21.2% of the total larvae (Tables 2,3). Northern anchovy ranked 2nd in incidence; *M. productus* ranked 8th. Larvae of *Sebastes* spp., a composite of about 70 species, ranked 3rd in number (13.9%) and first in occurrence. The lanternfish *Stenobrachius leucopsarus* ranked 4th in abundance (4.2%) and occurrence. A midwater gonostomatid, *Vinciguerria lucetia*, and the family Sciaenidae ranked 5th and 6th in abundance but only 13th and 29th in occurrence. The myctophid *Triphoturus mexicanus* also ranked in the top 10 in numbers (7th) and occurrence (9th). Jack mackerel larvae (*Trachurus symmetricus*) ranked 8th in numbers and 11th in occurrence. Two deepsea smelts (*Leuroglossus stilbius* and *Bathylagus ochotensis*) completed the top 10 taxa, ranking 9th and 10th in numbers and 5th and 6th in occurrence. The 10 taxa contributed 90.4% of all larvae taken during 1968; the remaining 9.6% was represented by 101 taxa plus the unidentified and disintegrated categories. Of the 10 taxa, 5 were midwater species, 2 were coastal pelagic species, and 3 were coastal demersal species or generic groupings.

## EXPLANATION OF TABLES

Table 1 - This table lists by cruise the pertinent station and tow data for 1968, the volume of water filtered and standard haul factor for each tow, the percent of sample sorted, and the total numbers of fish eggs and larvae. CalCOFI cruises are designated by four digits; the first two indicate the year and the second two the month. Within each cruise the data are listed in order of increasing line and station number (southerly and seaward directions); the order of station occupancy is shown on the station charts (Figures 2-4). Stations are designated by two groups of digits; the first set indicates the line and decimal fraction and the second set indicates the station on the line. Time is listed as Pacific Standard Time at the start of each tow in 24-hour designation. Methods for determining tow depth, volume of water strained, standard haul factor, and percent sorted were described in the methods section. The values for total fish eggs and larvae represent raw counts (unadjusted for percent sorted or standard haul factor). Ship codes are as follows: JD, *David Starr Jordan*; HO, *Horizon*

Table 2 - This table lists pooled occurrences of all larval fish taxa taken during 1968 in ranked order.

Table 3 - This table lists pooled counts of all larval fish taxa taken during 1968 in ranked order. Numbers are adjusted for percent sorted and standard haul factors.

Table 4 - This table gives numbers of fish larvae for each taxon, listed by station and calendar month in which the tow was taken. Counts are adjusted for percent of sample sorted and standard haul factor. The orders are listed in "phylogenetic" sequence modified from Nelson (1984). Subtaxa within each order are listed alphabetically. Page numbers for each taxon are given in the index at the end of the report.

Table 5 - This table is a summary of pooled occurrences of all larval fish taxa taken on CalCOFI surveys from 1961 to 1969. Taxa are listed in the same order as in Table 4.

## ACKNOWLEDGMENTS

The senior author originally identified larvae from CalCOFI cruises of 1968. Ronald Whyte coded each larval fish taxon or type and Rita Ford entered them into the computer. Debby Snow efficiently assisted in all aspects of data editing and retrieval. Larry Zins and James Ryan provided programming assistance. Dorothy Roll designed the CalCOFI data acquisition system and provided data processing support. Ken Raymond, Roy Allen, and Henry Orr helped with graphics and production of the

report. Lorraine Prescott and Diane Forsythe prepared the manuscript for printing. Paul Smith determined statistical outliers, provided assistance during geographical outlier checks and offered helpful suggestions throughout the project. Izadore Barrett, Director of the Southwest Fisheries Center and Reuben Lasker, Chief, Coastal Fisheries Resources Division, SWFC, provided the support critical to the completion of the project. James Thrailkill planned CalCOFI surveys and supervised cruises, data handling, and plankton sorting from 1949 to 1986 and is largely responsible for the high quality of these operations. Without the vision and direction of Elbert Ahlstrom and Elton Sette and the dedicated efforts of the many people who collected, processed, and analyzed the samples, this data base would not exist.

Figure 1. Composite arrangement of diagrammatic charts showing areas sampled on each CalCOFI cruise during 1968.

Figure 2. Station pattern for CalCOFI Cruise 6801 showing tracks for each vessel. Stations with plankton tows are indicated by a dot; circles designate hydrographic stations and diamonds signify STD recordings. Figures 2-4 modified from charts in Univ. of Calif., SIO (1971) to include only those stations listed in Table 1 of this report; see Table 1 for inshore stations not shown on charts.

Figure 3. Station pattern for CalCOFI Cruise 6804. Symbols as in Figure 2.

Figure 4. Station pattern for CalCOFI Cruise 6806. Symbols as in Figure 2.

Figure 5. The basic station plan for CalCOFI cruises from 1950 to the present.

TABLE 1. Station and plankton tow data for CALCOFI cruises in 1968. Counts for fish eggs and larvae are not adjusted for standard haul factor or percent of sample sorted.

TABLE 2. Pooled occurrences of fish larvae taken during CalCOFI cruises in 1968.

Rank	Taxon	Occurrences
1	<i>Sebastes</i> spp.	207
2	<i>Engraulis mordax</i>	188
3	<i>Protomyctophum crockeri</i>	139
4	<i>Stenobrachius leucopsarus</i>	127
5	<i>Leuroglossus stilbius</i>	116
6	<i>Bathylagus ochotensis</i>	106
7	<i>Citharichthys</i> spp.	101
8	<i>Merluccius productus</i>	95
9	<i>Triphoturus mexicanus</i>	92
10	<i>Bathylagus wesethi</i>	90
11	<i>Trachurus symmetricus</i>	85

## INDEX

This index lists taxa included in Table 4 with their page numbers.

	Page
Anguilliformes .....	34
Clupeiformes	
Clupeidae	
<i>Etrumeus acuminatus</i> .....	34
<i>Sardinops sagax</i> .....	34
Engraulidae	
<i>Engraulis mordax</i> .....	34
Salmoniformes	
Argentinidae	
<i>Argentina sialis</i> .....	37
<i>Microstoma microstoma</i> .....	38
<i>Nansenia candida</i> .....	38
<i>Nansenia crassa</i> .....	39
Bathylagidae	
<i>Bathylagus</i> spp. ....	39
<i>Bathylagus milleri</i> .....	40
<i>Bathylagus ochotensis</i> .....	40
<i>Bathylagus pacificus</i> .....	42
<i>Bathylagus wesethi</i> .....	42
<i>Leuroglossus stilbius</i> .....	44
Stomiiformes .....	46
Gonostomatidae	
<i>Cyclothona</i> spp. ....	46
<i>Diplophos taenia</i> .....	48
<i>Ichthyococcus</i> spp. ....	48
<i>Vinciguerria lucetia</i> .....	48
Sternoptychidae .....	49
Stomiatoidea	
Chauliodontidae	
<i>Chauliodus macouni</i> .....	51
Idiacanthidae	
<i>Idiacanthus antrostomus</i> .....	51
Melanostomiidae	
<i>Bathophilus</i> spp. ....	52
<i>Eustomias</i> spp. ....	52
Stomiidae	
<i>Stomias atriventer</i> .....	52
Myctophiformes	
Alepisauroidei	
Paralepididae .....	53
<i>Lestidiops ringens</i> .....	54
<i>Notolepis risso</i> .....	55
<i>Stemonosudis macrura</i> .....	55
Chloropthalmoidei	
Notosudidae	
<i>Scopelosaurus</i> spp. .....	55

	Page
Scopelarchidae .....	55
Myctophoidei	
Myctophidae .....	56
Lampanyctinae	
<i>Ceratoscopelus townsendi</i> .....	57
<i>Diaphus</i> spp. .....	58
<i>Lampadена urophaos</i> .....	59
<i>Lampanyctus</i> spp. .....	59
<i>Lampanyctus regalis</i> .....	60
<i>Lampanyctus ritteri</i> .....	60
<i>Notolychnus valdiviae</i> .....	62
<i>Notoscopelus resplendens</i> .....	62
<i>Stenobrachius leucopsarus</i> .....	62
<i>Triphoturus mexicanus</i> .....	64
Myctophinae	
<i>Diogenichthys</i> spp. .....	66
<i>Diogenichthys atlanticus</i> .....	67
<i>Diogenichthys laternatus</i> .....	68
<i>Gonichthys tenuiculus</i> .....	69
<i>Hygophum atratum</i> .....	69
<i>Myctophum nitidulum</i> .....	69
<i>Protomyctophum crockeri</i> .....	69
<i>Symbolophorus californiensis</i> .....	72
<i>Tarletonbeania crenularis</i> .....	73
Gadiformes	
Merlucciidae	
<i>Merluccius productus</i> .....	74
Macrouridae .....	76
Ophidiiformes .....	77
Bythitidae	
<i>Brosmophycis marginata</i> .....	77
Beloniformes	
Exocoetidae .....	77
Scomberesocidae	
<i>Cololabis saira</i> .....	78
Atheriniformes	
Atherinidae .....	78
Lampriformes	
Trachipteridae .....	78
Beryciformes	
Melamphaidae	
<i>Melamphaes</i> spp. .....	78
<i>Poromitra</i> spp. .....	80
<i>Scopelogadus bispinosus</i> .....	80
Syngnathiformes	
Syngnathidae	
<i>Syngnathus</i> spp. .....	81
Scorpaeniformes	
Cottoidei	
Agonidae .....	81
Cottidae .....	81
<i>Scorpaenichthys marmoratus</i> .....	81

	Page
Cyclopteridae .....	82
Hexagrammidae .....	82
<i>Ophiodon elongatus</i> .....	82
<i>Oxylebius pictus</i> .....	82
<i>Zaniolepis</i> spp. .....	82
Scorpaenoidei	
Scorpaenidae	
<i>Scorpaena</i> spp. .....	82
<i>Sebastes</i> spp. .....	83
<i>Sebastolobus</i> spp. .....	86
Perciformes	
Blennioidei	
Blenniidae	
<i>Hypsoblennius</i> spp. .....	86
Clinidae .....	86
Gobioidei	
Gobiidae .....	87
Labroidei	
Labridae .....	87
<i>Halichoeres</i> spp. .....	87
<i>Oxyjulis californica</i> .....	87
Pomacentridae	
<i>Chromis punctipinnis</i> .....	88
Percoidei	
Apogonidae	
<i>Howella brodiei</i> .....	88
Carangidae	
<i>Seriola lalandi</i> .....	88
<i>Trachurus symmetricus</i> .....	88
Kyphosidae	
<i>Girella nigricans</i> .....	90
<i>Medialuna californiensis</i> .....	91
Sciaenidae .....	91
Serranidae .....	91
Scombroidei	
Scombridae .....	92
Sphyraenoidei	
Sphyraenidae	
<i>Sphyraena argentea</i> .....	92
Stromateoidei	
Centrolophidae	
<i>Icichthys lockingtoni</i> .....	92
Stromateidae	
<i>Peprilus simillimus</i> .....	93
Tetragonuridae	
<i>Tetragonurus cuvieri</i> .....	93
Trachinoidei	
Chiasmodontidae .....	93
Pleuronectiformes .....	94
Pleuronectoidei	
Paralichthyidae	
<i>Citharichthys</i> spp. .....	94

	Page
<i>Citharichthys stigmaeus</i> .....	96
<i>Hippoglossina stomata</i> .....	97
<i>Paralichthys californicus</i> .....	97
Pleuronectidae	
<i>Glyptocephalus zachirus</i> .....	97
<i>Lepidopsetta bilineata</i> .....	98
<i>Lyopsetta exilis</i> .....	98
<i>Microstomus pacificus</i> .....	98
<i>Parophrys vetulus</i> .....	99
<i>Pleuronichthys</i> spp. ....	99
<i>Pleuronichthys coenosus</i> .....	100
<i>Pleuronichthys decurrens</i> .....	100
<i>Pleuronichthys ritteri</i> .....	100
<i>Pleuronichthys verticalis</i> .....	100
<i>Psettichthys melanostictus</i> .....	101
Disintegrated fish larva .....	101
Unidentified fish larva .....	102

## RECENT TECHNICAL MEMORANDUMS

Copies of this and other NOAA Technical Memorandums are available from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22167. Paper copies vary in price. Microfiche copies cost \$4.50. Recent issues of NOAA Technical Memorandums from the NMFS Southwest Fisheries Center are listed below:

- NOAA-TM-NMFS-SWFC- 89 Summary of distribution records of the spinner dolphin, *Stenella longirostris*, and the pantropical spotted dolphin, *S. attenuata*, from the western Pacific Ocean, Indian Ocean and Red Sea.  
J.W. GILPATRICK, JR., W.F. PERRIN, S. LEATHERWOOD, and L. SHIROMA  
(October 1987)
- 90 Summary of worldwide locality records of the striped dolphin, *Stenella coeruleoalba*.  
C.E. WILSON, W.F. PERRIN, J.W. GILPATRICK, JR., and S. LEATHERWOOD  
(December 1987)
- 91 Micropatch sampler data.  
R.W. OWEN and C.A. KIMBRELL  
(December 1987)
- 92 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1961.  
E.M. SANDKNOP, R.L. CHARTER, H.G. MOSER, C.A. MEYER, and A.E. HAYS  
(January 1988)
- 93 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1962.  
B.Y. SUMIDA, R.L. CHARTER, H.G. MOSER, and D.L. SNOW  
(January 1988)
- 94 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1963.  
D.A. AMBROSE, R.L. CHARTER, H.G. MOSER, and B.S. EARHART  
(January 1988)
- 95 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1964.  
E.M. SANDKNOP, R.L. CHARTER, H.G. MOSER, C.A. MEYER, and A.E. HAYS  
(January 1988)
- 96 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1965.  
E.G. STEVENS, R.L. CHARTER, H.G. MOSER, and L.R. ZINS  
(January 1988)
- 97 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1966.  
B.Y. SUMIDA, R.L. CHARTER, H.G. MOSER, and D.L. SNOW  
(January 1988)
- 98 Ichthyoplankton and station data for California Cooperative Oceanic Fisheries Investigations survey cruises in 1967.  
D.A. AMBROSE, R.L. CHARTER, H.G. MOSER, and B.S. EARHART  
(January 1988)
